Yuti Desai

Feature Of The Language

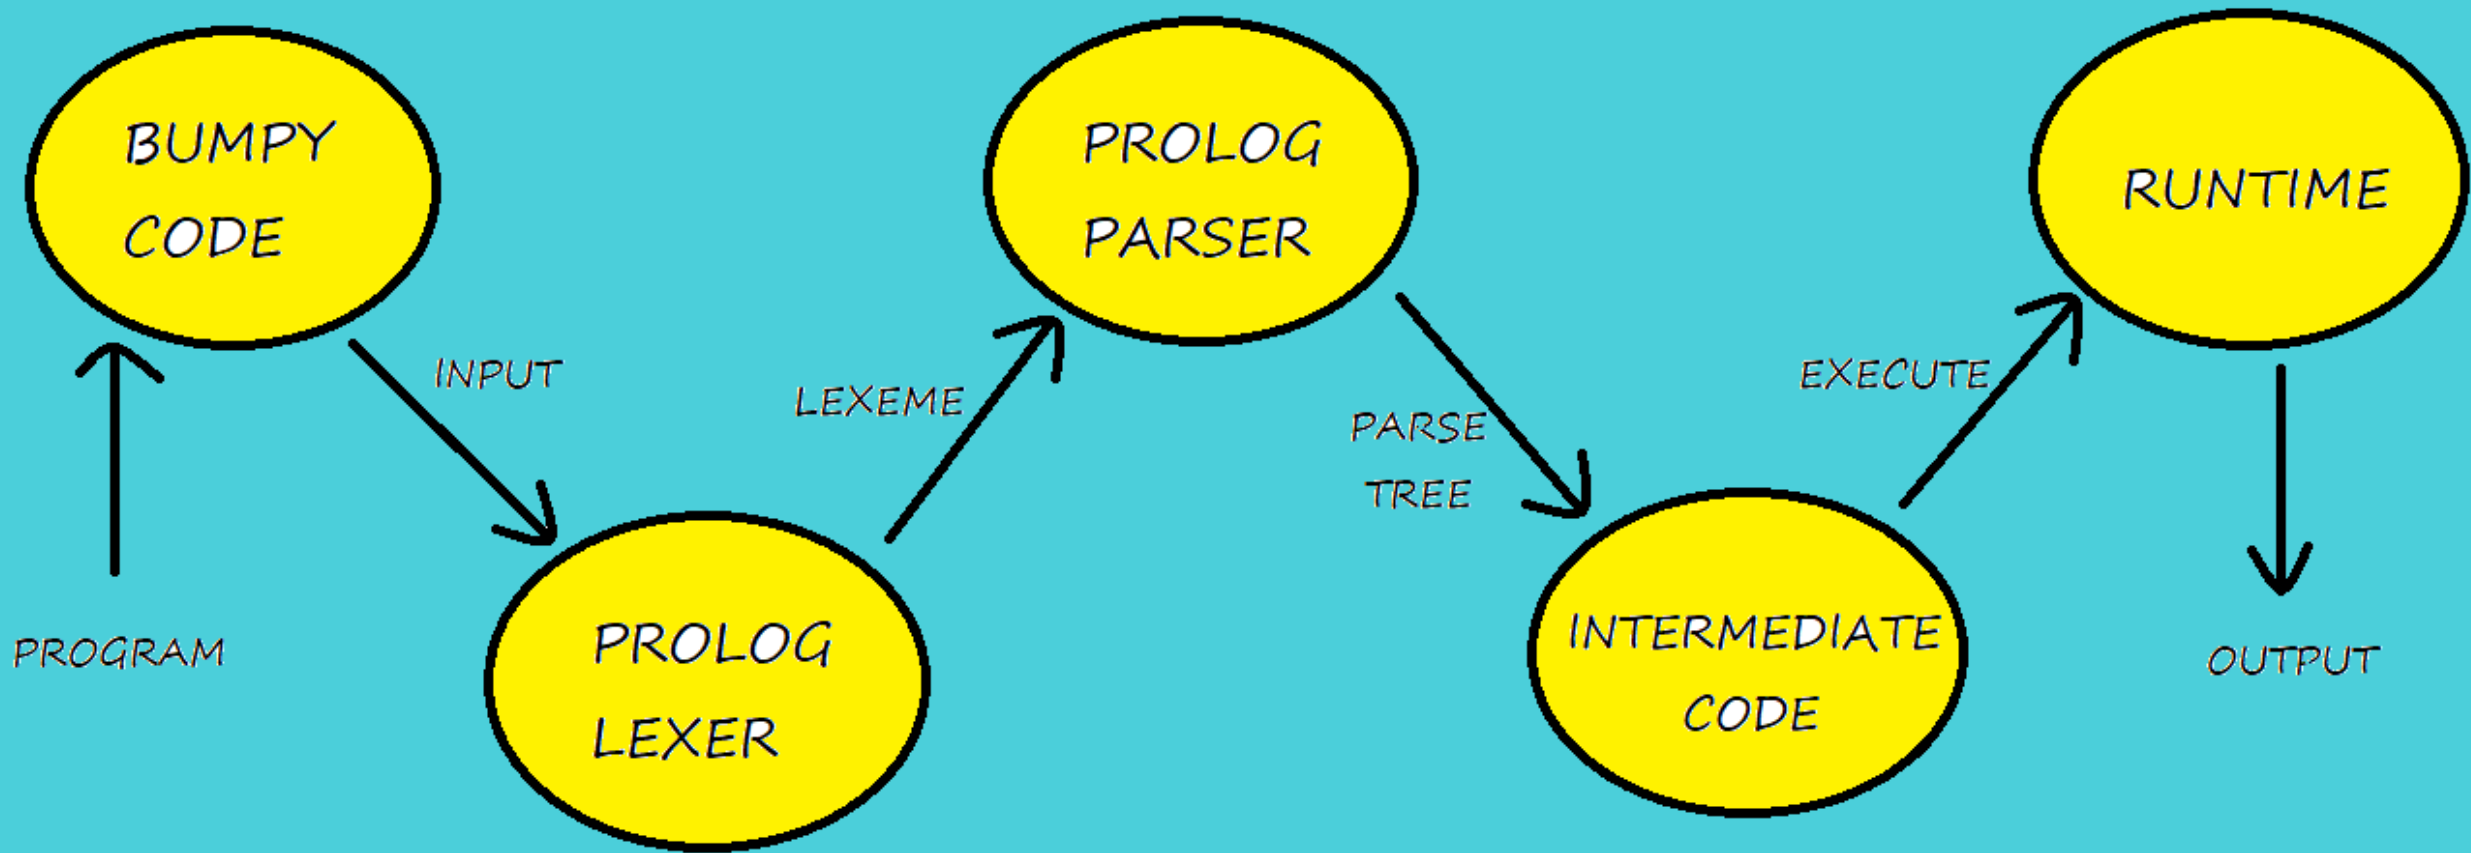

- Bumpy Language is developed in Prolog Completely
- We are using Top- down parsing technique
- Data structures used by the parser and interpreter: List
- Interpreter: Our interpreter is based on Reduction machine.
- It is an Imperative language and Statically typed
- It provides data types such as Integer and Boolean
- Looping construct – while loop
- Decision control statement – if-else statement
- inspired by C language

Operators and Constructs For BUMPY

- Operators: +, -, *, /, %, <, >, <=, >=, ~=, :=, =, and, or,
- Arithmetic Operator: +, -, *, /, %
 - Addition : +
 - Subtraction: -
 - Multiplication: *
 - Division: /
 - Mod: %
- Comparison Operator: <, >, <=, >=, ~=, :=:
 - Less than: <
 - Greater than: >
 - Less than equal to: <=
 - Greater than equal to: >=
 - Not equals to: ~=
 - Equals to: :=:

Operators and Constructs For BUMPY

- Assignment Operator: =
- Boolean Operator : and, or ,not
- Primitive types: bool, var
 - Bool : takes Boolean value
 - Var: takes integer value
- Decision Constructs: incase do otherwise endcase
 - Incase (condition) do (process) otherwise (process) endcase
- Iterative Constructs: when repeat endrepeat
 - When (condition) repeat (process) endrepeat

Design Flow

Lexical Analyzer and Parser

- Lexical Analyzer and Parser written in Prolog Definite Clause Grammar.
- Once the program is fed to the Lexer, it generates a list of lexemes for program by identifying keywords, eliminating spaces, tabs and new lines.
- After getting the tokens, tokens are passed through the parser which is a prolog DCG code with the grammar defined for the language using prolog predicates and it generates the parse tree for the given code.
- It Parses in a top-down fashion.

Intermediate Code

- Parse tree is itself the intermediate code as we are using Prolog for creating language.
- It gives Intermediate code as output to a separate file.
- Intermediate Code is generated using DCG as well.
- Used interpreter to evaluate the intermediate code.

Runtime/Interpreter

- Programmed in Prolog.
- The Interpreter is implemented by traversing node by node through the generated parse tree. Each node denotes an evaluation step that needs to be performed
- The environment at each node is looked up or updated via a list data structure in prolog.
- Used reduction rules to evaluate the code.

Language Grammar

- Parser \rightarrow Program
- Program \rightarrow Comment Block | Block
- Comment \rightarrow @ Words @
- Block \rightarrow start Declaration Process stop
- Words \rightarrow Identifier Words | Numb Words | Identifier | Numb.
- Declaration \rightarrow Datatype Identifier ; Declaration | Datatype Identifier ;
- Process \rightarrow Assignvalue ; Process | Control Process | Iterate Process |
Print Process | ReadValue Process | Assignvalue ; | Control | Iterate |
Print | ReadValue

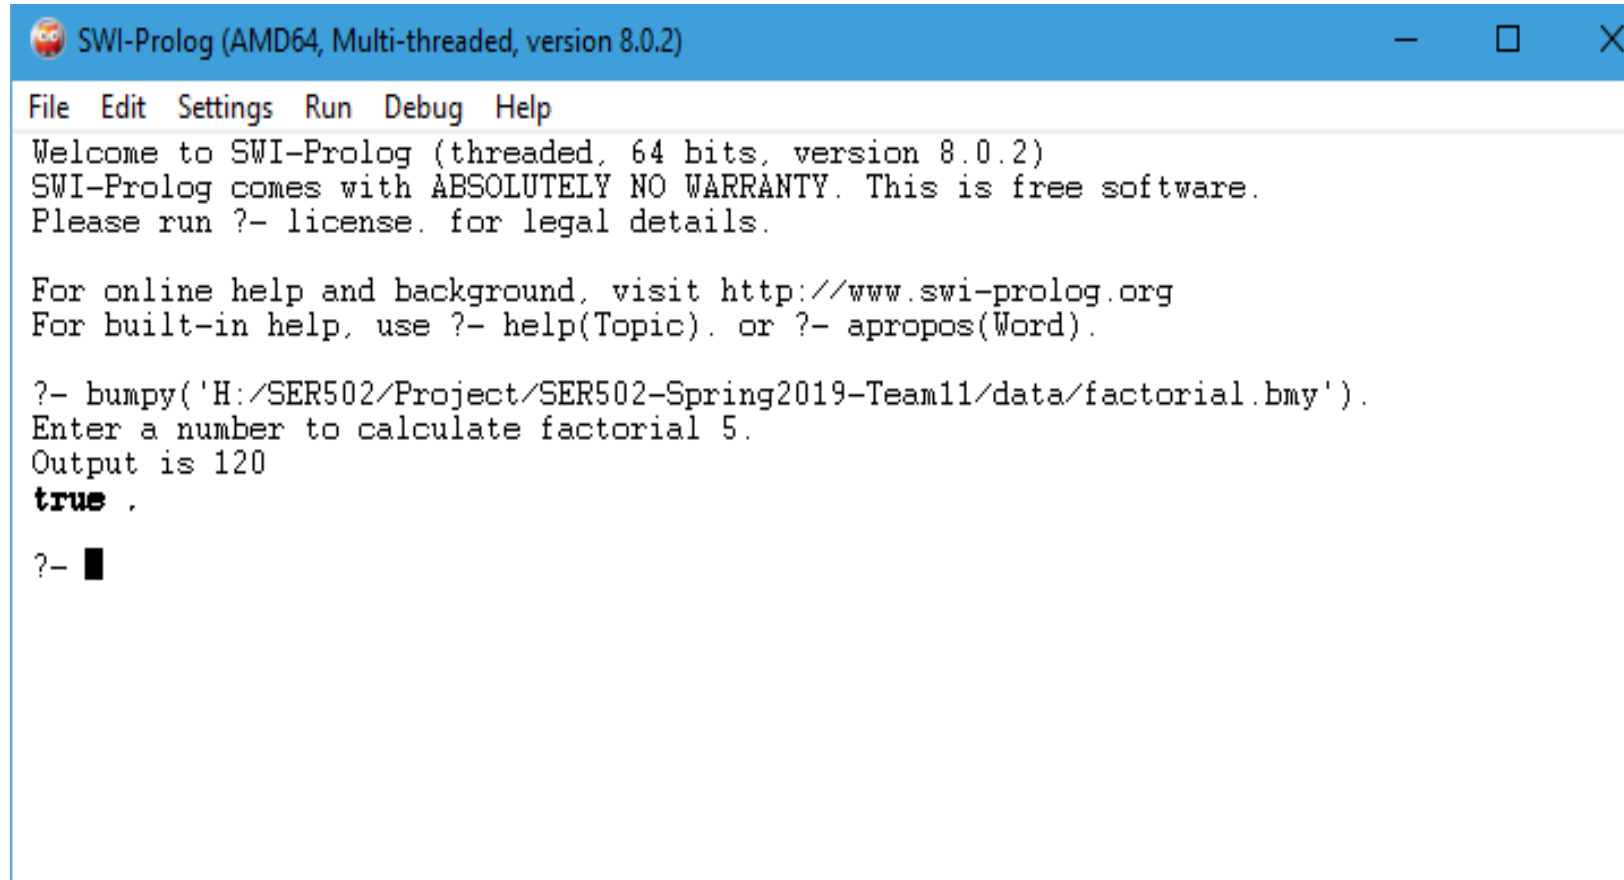

Language Grammar (Continued..)

- Datatype \rightarrow var | bool
- Assignvalue \rightarrow Identifier = Expression | Identifier is Boolexp
- Control \rightarrow incase Condition do Process otherwise Process endcase
- Iterate \rightarrow when Condition repeat Process endrepeat
- Print \rightarrow show Expression ; | show * value * ;
- ReadValue \rightarrow input Identifier ;
- Condition \rightarrow Boolexp and Boolexp | Boolexp or Boolexp | \sim Boolexp | Boolexp

Language Grammar (Continued..)

- $\text{Boolexp} \rightarrow \text{Expression} ::= \text{Expression} \mid \text{Expression} \sim= \text{Expression} \mid \text{Expression} \leq \text{Expression} \mid \text{Expression} \geq \text{Expression} \mid \text{Expression} < \text{Expression} \mid \text{Expression} > \text{Expression} \mid \text{Expression} ::= \text{Boolexp} \mid \text{Expression} \sim= \text{Boolexp} \mid \text{yes} \mid \text{no}$
- $\text{Expression} \rightarrow \text{Term} + \text{Expression} \mid \text{Term} - \text{Expression} \mid \text{Term}$
- $\text{Term} \rightarrow \text{Identifier} * \text{Term} \mid \text{Numb} * \text{Term} \mid \text{Numbneg} * \text{Term} \mid \text{Identifier} / \text{Term} \mid \text{Numb} / \text{Term} \mid \text{Numbneg} / \text{Term} \mid \text{Identifier} \bmod \text{Term} \mid \text{Numb} \bmod \text{Term} \mid \text{Numbneg} \bmod \text{Term} \mid \text{Identifier} \mid \text{Numb} \mid \text{Numbneg}$
- $\text{Identifier} \rightarrow _ [^a-z] \text{alphanumeric} \mid [^a-z] \text{alphanumeric}$
- $\text{Numb} \rightarrow \text{number}$
- $\text{Numbneg} \rightarrow - \text{Numb}$

Demonstration: Executing Prolog Files

```
SWI-Prolog (AMD64, Multi-threaded, version 8.0.2)
File Edit Settings Run Debug Help
Welcome to SWI-Prolog (threaded, 64 bits, version 8.0.2)
SWI-Prolog comes with ABSOLUTELY NO WARRANTY. This is free software.
Please run ?- license. for legal details.

For online help and background, visit http://www.swi-prolog.org
For built-in help, use ?- help(Topic). or ?- apropos(Word).

?- bumpy('H:/SER502/Project/SER502-Spring2019-Team11/data/factorial.bmy').
Enter a number to calculate factorial 5.
Output is 120
true .
